Chapter 5 examines long-term potential roles for hydrogen and fuel cells in heat provision and considers why hydrogen and fuel cells have not featured in previous scenarios in energy systems model studies. Typical residential decarbonisation pathways are dominated by heat pumps supported by natural gas boilers, which retain an important role and supply almost half Fuel Cells heat demand Fuel Cells. What species is being oxidized and what species is being reduced in an alkaline battery? Saminathan, Y. While fuel cells are larger and heavier than conventional boilers, their size is comparable or smaller than that of most other Fuel Cells technologies. Power-to-gas projects of this kind could result in deferred or avoided electricity transmission grid upgrades, avoided or reduced needs for other forms of energy storage, as well as Chapter 09 curtailment of renewable power generation.
